

## E-prescribing GSK vaccines for pharmacy administration E-prescribing directly to pharmacy via eMDs Solution Series EHR

While in-office vaccinations are common, there are certain cases in which a practice may refer the patient to the pharmacy for vaccination—either they do not stock a particular GSK vaccine, they do not offer vaccination services, or the vaccine is covered in the patient’s pharmacy benefit, such as Medicare Part D. In these cases, the provider can electronically generate (or e-prescribe) a vaccine in eMDs Solution Series EHR directly to a patient’s pharmacy for administration.

To e-prescribe a vaccine in an electronic health record (EHR) system, the provider must select multiple prescription elements, such as dosing and quantity, to order the specified product accurately. The process is similar to e-prescribing medications and should be familiar to the provider.

### Benefits of e-prescribing directly to a patient’s pharmacy

Practices that cannot, or choose not to, vaccinate a patient in the office can e-prescribe the vaccine to the patient’s pharmacy for administration. This will record the provider’s recommendation for a vaccine in the patient record. Also, when the vaccine is administered in the pharmacy, the pharmacist may report the vaccination to the state immunization registry, and the vaccination could also be reported back to the patient record through the medication history. E-prescribing a vaccine for administration in the pharmacy will help ensure that patients get appropriate vaccines and will help document that vaccination in the patient record for better care coordination.

### Considerations when e-prescribing a GSK vaccine:

EHRs may not have exact dosing, packaging, or quantity specific for a vaccine in the default selections in the prescription form. To electronically prescribe a vaccine, providers must include these prescription elements to order the vaccine accurately.

## Saving vaccines as Favorites for e-prescribing

The **My Favorite** feature enables the provider to create a shortcut for frequently written prescriptions and to save appropriate variables to be included for each prescription. **My Favorite** reduces the number of clicks needed to create a prescription and help ensure consistency in selecting the correct dose, quantity, and dispense unit of measure.

- **My Favorite** can be saved by the individual provider or shared across the practice or an entire health system
- The ability to save as a **My Favorite** may be limited to select users with specific system privileges or subject to practice business policies

## E-prescribing vaccines in eMDs Solution Series EHR

Some practices send patients to local pharmacies to have vaccines administered. In these cases, the prescriptions can be handwritten, or more efficiently, e-prescribed from within the eMDs Solution Series EHR.

For a prescription to be written for a vaccine, the vaccine must be available for selection in the eMDs Solution Series EHR product list.

When e-prescribing a vaccine with multiple doses in the series, custom instructions (**SIG**) can be created to administer the entire series (such as: administer first dose Day 1 and administer second dose 90 days later). Instructions to the pharmacist to administer the entire series can also be written in the **Notes to Pharmacy** section of the e-prescription. The **Notes to Pharmacy** instructions are saved with **QuickPicks**, so they can be included each time an e-prescription for a vaccine is selected from **QuickPicks**.

In eMDs Solution Series EHR, providers order prescriptions in the **Rx Writer** and transmit them electronically to the patient's pharmacy.

## To e-prescribe a vaccine

- Search for the vaccine using the **Search by, Drug Name** field in the **Prescribe Medication** window
- Select the desired vaccine
