

## Adding a new GSK medication or vaccine to athenaClinicals EHR

---

To prescribe a medication or vaccine in the athenaClinicals EHR, it must already be in the medication database. **athenaClinicals does not support the ability for an end user to add, update, or delete medications or vaccines in the drug database.** If the GSK medication or vaccine is not in the database, the system is not capable of writing in the new product for single time use, nor is it possible for users to manually add it to the database.

It is recommended that the practice log a ticket with the athenaClinicals EHR support personnel, who can manually update the database, or to wait for the weekly database update. Because athenaClinicals EHR is a web-based EHR, updates are frequent and automatic to the practice.
